SCADE (Schematic Capture and Design Environment) is a computer-aided design (CAD) system used for developing BOMs, RFCs, designs and mechanical layouts. It is used by some CAD vendors including GlobalFoundries and others.

MSCAD is a CAD program used to design MOSFET devices, PMOS devices, and NMOS devices. SEMCAD is a CAD system used to design integrated circuits. UGENS is a CAD system for producing BOMs in support of off-the-shelf manufacturing. Inputs There are several types of inputs, most of which connect to the computer using USB. Handheld trackball: An input device that allows the user to move the cursor on a

computer screen by turning a ball on the input device. X-Y mouse: An input device that allows the user to move the cursor on a computer screen by moving the device along the X and Y axis. This is a common interface for general desktop use. Touch: A popular form of input device that uses a touch surface such as glass or other hard material which the user touches with their finger. The input is interpreted by the computer as a point of contact,

and this is how the user controls what is shown on the screen.

Optical mouse: An input device that allows the user to move the cursor on a computer screen by moving the device across a glass surface using optical sensors.

They are popular for use with laptops and have become increasingly popular in recent years. Some of the better quality models use radiofrequency technology which allows the cursor to move with a smaller

area of contact. **Trackball:** An input device that allows the user to move the cursor on a computer screen by rotating a ball on a trackball. **Thumbstick:** An input device that allows the user to move the cursor on a computer screen by rotating a trackball. **Joystick:** An input device that allows the user to move the cursor on a computer screen by moving a rod or lever. A basic type of this can be seen on some video game controllers. **Force-sensitive pen:**

An input device that allows the user to move the cursor on a computer screen by writing on a tablet. There is a substantial body of research into how this can be used to control the cursor on the screen. Stylus: An input device that allows the user to move the cursor on a computer screen by drawing on a tablet. In the past stylus input was used a1d647c40b

Q: Is it possible to configure the RPE in R Markdown to include a particular paper when the backreferences are complete? When I write a paper in R Markdown and reference previous papers in the footer, this often creates a mess because there are multiple backreferences in the same document that are not in the same order. For example: Here is an R Markdown

document with references at the bottom.

```
\include{figures/paper2/fig1}
```

```
\include{figures/paper2/fig2}
```

```
\include{figures/paper2/fig3}
```

```
\include{figures/paper2/fig4}
```

```
\include{figures/paper2/fig5}
```

When referencing all of these papers at once, you get something like this: Figures/paper2/fig1

Figures/paper2/fig2

Figures/paper2/fig3

Figures/paper2/fig4

Figures/paper2/fig5 However, if I

have a paper with backreferences of their own, it's not possible to keep them all in a single document. For example:

```
\chapter{Paper with  
Backreferences} \chapter{Paper  
with Backreferences}
```

```
Figures/paper3/fig1
```

```
Figures/paper3/fig2
```

```
Figures/paper3/fig3
```

```
Figures/paper3/fig4
```

```
Figures/paper3/fig5
```

When referencing all of these at once,

you get: Figures/paper3/fig1

Figures/paper3/fig2

Figures/paper3/fig3

Figures/paper3/fig4

Figures/paper3/fig5 If you manually put them in order, you end up with the messy R

Markdown document:

Figures/paper2/fig1

Figures/paper2/fig2

Figures/paper2/fig3

Figures/paper2/fig4

Figures/paper2/fig5

Figures/paper3/fig1

Figures/paper3/fig2

Figures/paper3/fig3

Figures/paper3/fig4

Figures/paper3/fig5 Is it possible to make R Markdown use a different paper for the backreferences at the end of a document,
