Legacy When the initial versions of AutoCAD were released, the user-interface and functionality closely resembled that of a drafting program, despite the fact that it was intended as a general-purpose CAD system. For example, instead of using a 2D mouse to move around the screen, the user used a 3D mouse to move around the physical plane represented by the monitor. Similarly, CAD applications used drop-down menus rather than graphical buttons; these drop-down menus were the only way to interact with the software. AutoCAD 2005 introduced a few interface changes to more closely match the other AutoCAD

functions. These included importing and exporting DXF files, creating and editing block definitions, and adding views. AutoCAD 2007 added a new user interface and "drag and drop" functionality, such as moving blocks and page elements between pages. Like other Windows-based programs, AutoCAD was not originally designed for use in a network environment. In particular, for many years the only way to share work between multiple users was by sharing a single AutoCAD session, which by default locked out the other users. This was not ideal, as the other users might not always be available or authorized to work with another user's files. The user interface in AutoCAD has changed over time. On the initial release of AutoCAD, there were three primary functions. These were represented by the following icons: There was an error indicator which appeared if there was a problem with the active drawing or the active layer, or if an undefined variable was used. This was represented by the following icon: The structure editor contained features for viewing and editing block definitions. It was located in the Utilities folder in the Program Files directory. The drawing editor contained features for drawing, editing, and formatting elements on the screen. It was located in the Draw menu, and was represented by the following icon: In AutoCAD 2005, these icons changed slightly. Instead of the error indicator, a small red dot represented a problem. Also, the structure editor and drawing editor no longer displayed the icons representing each function. Instead, they were replaced with a status bar which would display the current status of the function and an error when there was a problem. The cursor was also changed slightly. In earlier versions, the cursor would look like the "i" button on a mouse. In AutoCAD 2005, the cursor looked more like a capital "L" for "l a1d647c40b"
